ABSTRACT
The word herb, as used in herbal medicine, is also known as botanical medicine or as phototherapy or phytomedicine which means a plant or plant part is used to make medicine to assist in the healing process during illness and disease. *Pongamia pinnata* (Linn.) Pierre is shrubs to long tree well known as Honge-mara in Kannada. In the Indian Ayurvedic literature, various parts of this plant have been recommended as a remedy for various ailments. Different parts of the plant have been used in traditional medicines. Its root, bark, leaves, sap, and flower also have medicinal properties and traditionally used as medicinal plants. It is a preferred species for controlling soil erosion and binding sand dunes because of its dense network of lateral roots. Various Phytoconstituents belonging to alkaloids, glycosides, flavonoids, fixed oils and carbohydrates and many more Phytoconstituents is been isolated from the plant *Pongamia pinnata* (Linn.) Pierre. Hence this review has a collection of information on the phytoconstituents, pharmacological activities and a biofuel property of the plant.

Keywords: *Pongamia pinnata* (Linn.) Pierre, Phytoconstituents, Pharmacology, Bio fuel.

INTRODUCTION
A genus *Pongamia* of probably 2 species sometimes included as a section *Pongamia* (Adans.) J. Bennet in larger genus *Derris*. It is recognized by its panicles of white or pink flowers and round, 1 seeded fruit. The two species like *Pongamia pinnata*, *Pongamia velutina* in tropical Asia in coastal environments, including mangal, but it is also recorded inland to altitudes of over 500 m. *Pongamia* is a medium size, nitrogen fixing tree native to India, Indonesia, Malaysia, and Myanmar. It has been successfully introduced to humid tropic lowland worldwide and to parts of Australia, China, NewZewland and United States. *Pongamia* trees are legumes so it helps in replenish soil nitrogen. The *pongamia* growth is estimated at more than 1 million hectares each in India and Philippines, more than 3 million hectares in Myanmar and more than 5 millions hectares in Indonesia. Since *Pongamia pinnata* (Linn.) Pierre has a vast use in the medical field and as biofuel some of its chemical and pharmacological properties are discussed in this review.

*Pongamia pinnata* (Linn.) Pierre 1989 (Fl. For. Cochinch.Sub.t.385)

Synonyms: Pongamia glabra Vent; Dalbergia arborea Wild; Galedupa indica Lamk; Pongamia pinnata (Linn) Merr

Natural order: Leguminosae

Sub Family: Papilionaceae- Fabaceae

Unani Tibbi name: Karanj

Ayurvedic: Nakmaal, Guchpushpak, Ghritpuur, Udkirya, Kananja, Siddha-Pungu

Vernacular Names

Sanskrit- Karanja, Nakamala; English- IndianBeech; Hindi- Karanj; Punjab-Sukhchain; Bengal- Dahar-Karanja; Telugu- Kanugachettu; Tamil and Malayalam- Pungammaram; Kannada- Honge-mara.

BOTANICAL DESCRIPTION
A medium sized semi evergreen glabrous tree with a short bole and spreading crown up to 18 m or more in height, bark grayish green or brown , very often mottled with dark brown dots, specks, lines or streak; leaves compound, leaflets 5-7 ovate, acuminate or elliptic; flowers lilac or pinkish white, fragrant, in axillary racemes; fruits thick, woody, smooth, compressed, with a short curved beak, seeds 1 or 2 per pod, reniform to nearly round, smooth or wrinkled, testa reddish brown leathery.
Habitat: This tree is common all over India, and met from central Himalaya to southern India and Ceylon. It is of six varieties: In Bengal- Dahar Karanja; Makara Karanja; Bish Karanja and Amba Karanja. Karanja is one of the varieties called Kanta- Karanja. Karanj is found in hilly region in south India up to an elevation of about 1220 mt and in Himalayas up to about 610 mts. It is found chiefly among streams and rivers and is common in the tidal and beach and dune forests along the sea shore.

Medical Action
Rasa- Bitter, astringent and pungent; Guna- Light (The fruits and leaves). Light, sharp and Unctuous (the oil); Virya-Hot; Vipaka- Pungent.

Flowering and fruiting: The tree flowers from about April to July and the pods ripen from about February to May in the following years. The exact period of flowering and fruiting of course, differs from locality to locality. Soil- Deep sandy loams with abundant moisture. Temperature- Max: 38° to 49°; Min: -1° to 16°. Rainfall- Annual rainfall from 510 to 2540 mm. are the ideal conditions for the cultivation of the plant.

BOTANICAL CLASSIFICATION

kingdom Plantae
Division magnoliophyta
Class magnolipsida
Order fabales
Family leguminosae
Genus Pongamia
Species pinnata

TRADITIONAL USES

Seed oil- Applied to skin disease, in scabies, sores, herpes and the like cases of eczema have been benefited by applying a mixture of the oil and zinc oxide. Internally the oil has sometimes been used as stomachic and cholagogue in case of sluggish liver. Oil is styptic, anthelmintic, and good in leprosy, piles, ulcers, chronic fever and in liver pain. Useful in rheumatism arthritis scabies, whooping cough.

Leaves- Decoction of leaves is applied as bath or fomentation to rheumatic joints. Leaves are also used in diarreha and in cough. Juice of leaves in treatment of flatulence, dyspepsia and diarrhoea. Young leaves are applied to bleeding piles. Juice of leaves is used for cold, cough, diarrhoea, dyspepsia, flatulence, gonorrhoea, leprosy.

Stem- Juice of stem in remedy for Gonorrhoea. Aqueous extracts of stem bark exhibit significant CNS sedative and antipyretic activity.

Root- Juice in treatment of Gonorrhoea, urethritis, good for cleaning foul ulcer, cleaning teeth, strengthening gums and gonorrhoea. Juice of roots with coconut milk and lime water used for treatment of gonorrhoea.

are bitter anti-helminthic and used in vaginal and skin diseases. Juice of the root is used for cleansing foul ulcers and closing fistulous sores.

Seed- Pulp of seed is an application in leprosy. Commonly used in Bronchitis and whooping cough. Used for keloid tumors. Used in hypertension, skin ailments and rheumatic arthritis. Seed powder valued as a febrifuge, tonic and in bronchitis and whooping cough.

Useful in inflammations, pectoral diseases, chronic fevers, hemorrhoids and anemia.

Bark- Useful internally in bleeding piles. It is anthelmintic and alexeteric and useful in hemorrhoids, beriberi, ophthalmopathy, dermatopathy, vaginopathy and ulcer. For bleeding piles, for beriberi, reduce swelling of the spleen. Useful in mental disorder, cough and cold.

Flowers- Dried flowers in powder in combination with other ingredients is given as decoction in diabetes to quench thirst. Useful to quench dyspepsia in diabetes, for bleeding piles.

Fruits- Fruits used for abdominal tumors. Useful in ailments of female genital tract, leprosy, tumors, piles, ulcers and upward moving of the wind in the abdomen.

Seeds, leaves, roots and oil are Antiparasitic.

PHYTOCONSTITUENTS

Seeds- Reported to contain alkaloids demethoxy-kanugin, gamatay, glabrin, glabrosoapalin, kaempferol, kankone, kanugin, karanin, neoglabrin, pinnatin, pongoamol, pongarin, quercitin, saponin, β-sitosterol and tannin. Seeds have 19.0% moisture, 25.7% fatty oil, 17.4% protein, 6.6% starch, 7.3% crude fibre and 2.4% ash.

The proximate composition of P. pinnata seeds was: 3.8% ash, 9.7% sugar, 7.07% protein, 24% oil, 10.7% free amino acids, and 0.24% free fatty acids. The oil was extracted from seeds by use of different solvents and the highest yield (29%) was obtained by use of n-hexane. Seeds in addition gave lanceolatin B, iso-pongachromone and pongo galabrone.

Bark- contains a bitter alkaloid, resin, mucilage, sugar, but no tannin. From the stem bark of Pongamia pinnata, two new compounds, 3-methoxy-(3,4-dihydro- 3-hydroxy-4-acetoxy)-2,2-dimethylpyrano-(7,8:5,6)-flavone and 3-methoxy-(3,4-dihydro-4-hydroxy-3-acetoxy)-2,2-dimethylpyrano-(7,8:5,6)-flavone, were isolated, along with six known compounds, caryophyllene oxide, obovatachalcone, 8-hydroxy-6-methoxy-3-pentyl-1H-isochromen-1-one,6,7,2,2-dimethylchromono-8,9-dimethylallylflavanone, isolonchocarpin, ovaliflavone A. Their structures were determined on the basis of the spectroscopic data interpretation.

Leaves- also contain a bitter substance. The qualitative phytochemical study reveals the presence of alkaloids, carbohydrates, phytosterols, saponins, tannins and flavonoids in leaves. Chromatographic separation of a 70% aqueous methanol extract (AME) of leaves has led to...
the isolation of two new isoflavonoid diglycosides, 4'-O-methyl-genistin 7-O-beta-D-rutinoside and 2',5'-dimethoxy-genistin 7-O-beta-D-apiofuranosyl(1''6'')-O-beta-D-glucopyranoside, and a new retinoid, 12a-hydroxy-alpha-taxicarol, together with nine known metabolites, vecinin-2, kaempferol 3-O-beta-D-rutinoside, rutin, vitexin, isoquercitrin, kaempferol 3-O-beta-D-glucopyranoside, 11,12a-dihydroxy-munduserone, kaempferol, and quercetin\(^{24}\). Manurial values of leaves and twigs are respectively: nitrogen 1.16, 0.71; phosphorus 0.14, 0.11; potash 0.49, 0.62; and lime (CaO), 1.54, 1.58\(^{29,30}\). The decoction of leaves showed presence of carbohydrates, proteins, saponins, tannins and flavonoids\(^{35-40}\).

**Seed oil** contains Karanjin (S\(_{18}\)H\(_{26}\)O\(_{3}\)); Fatty acid present in oil include myristic 0.23, palmitic 6.06, stearic 2.19, arachidic acid 4.30, Lignoceric acid 3.22, Dihydro stearic 4.36, Linoenic acid 0.46, Lenolic acid 9.72, oleic acid 61.30 percent, together with 3.56% of unsaponifiable matter\(^{41}\). Phytochemical evaluation of Pongamia pinnata seed oil resulted in the isolation of methyl oleate and 3'-methoxy (2'',3''7.8) furanoflavone. These compounds were characterized on the basis of spectral and other data. **seed** oil gave Karanjin, pongamol, pongapin and Kanjone. Glabrachalcone was isolated from the seed oil\(^6\).

**Flowers** yield simple flavones, hydroxyl furanoflavones, chenofoflavanone, triterpenes, beta sitosterol glucoside and aurantiamide acetate.

**Roots** Some of the anticancer compounds like Paclitaxel, Flurophenylalanine, Vinblastin, Vinchristine (Sulphate), Teniposide, Flouoxetine, Oetoposide derivatives are present in the root extract of Pongamia pinnata\(^{41}\).

**PHARMACOLOGICAL ACTIVITIES**

**Anti-Plasmodia activity**

The ethanolic extracts of Pongamia pinnata were examined in vitro for antiplasmodial properties against *Plasmodium falciparum*. This ethanol extract of Pongamia pinnata shows significant anti-plasmodial activity\(^{42}\).

**Anti-Inflammatory activity**

The ethanolic extract of Pongamia pinnata seed had exhibited an anti-inflammatory effect in chemically induced anti inflammatory rat. Different solvent fractionated extracts were evaluated for anti-inflammatory effect. Anti-inflammatory effects of Pongamia pinnata were best seen against bradykinin and PGE1-induced inflammation. In contrast minimal effects were seen against histamine and 5-HT-induced inflammation. The predominant action of extracts of Pongamia pinnata appears to be a modulation of eicosanoid-events in inflammation\(^{43}\).

The anti-inflammatory activity of aqueous extract of Pongamia pinnata stem bark (PPSB) in acute and chronic models of inflammation was evaluated in albino rats. Oral administration of PPSB (400, 800 mg/kg) exhibited significant anti-inflammatory activity in acute...
PPSB hold significant anti-inflammatory activity without ulcerogenic activity. This anti-inflammatory and analgesic potential of the methanolic extract of *Pongamia pinnata* stem bark (PSBE) in was evaluated. PSBE (200, 500 and 1000 mg/kg) exhibited significant anti-inflammatory activity in acute (carrageenin induced hind paw edema) and chronic (cotton pellet granuloma) models of inflammation PSBE. The analgesic activity was tested by acetic acid-induced writhing response in albino mice and tail flick method in albino rats. Its methanolic extract shows the most effective anti-inflammatory activity at doses of 200, 500 and 1000 mg/kg significantly throughout the observation period. In the tail flick model, the PSBE showed dose-dependent action in all experimental animal models.

In the present study, the anti-inflammatory activity of 70% ethanolic extract of *Pongamia pinnata* leaves (PLE) in acute, subacute and chronic models of inflammation was assessed in rats. p.o. administration of PLE (300, 1000 mg/kg) exhibited significant anti-inflammatory activity in acute (carrageenin, histamine, 5-hydroxytryptamine and prostaglandin E2-induced hind paw edema), subacute (kaolin-carrageenin and formaldehyde-induced hind paw edema) and chronic (cotton pellet granuloma) models of inflammation. This indicates that PLE possesses significant anti-inflammatory activity without ulcerogenic activity.

**Anti-diarrhoeal Activity**

The crude decoction of dried leaves of *Pongamia pinnata* was evaluated for anti-microbial effect and also its action on enterotoxins (cholera toxin, Escherichia coli labile toxin and *E. coli* stable toxin) and adherence of enteropathogenic *E. coli* and invasion of enteroinvasive *E. coli* and *Shigella flexneri* to epithelial cells. The decoction had no anti-bacterial, anti-giardial, and anti-rotaviral activities, but reduced production of cholera toxin and bacterial invasion to epithelial cells. Thus it suggest that it is not active against toxin induced diarrhea or those caused by protozoa and virus. Amongst bacterial diarrhea, it appears to be most efficacious against cholera and enteroinvasive bacterial strains causing bloody diarrheal episodes. These results support their traditional use as an anti-diarrheal therapy.

**Anti bacterial Activity**

The antibacterial activity of Karanj (*Pongamia pinnata*) and Neem (Azadirachta indica) seed oil in vitro against fourteen strains of pathogenic bacteria was assessed by using the tube dilution technique at concentration of 125 micro/mL, 250 micro/mL and 500 micro/mL. The activity with both the oils was bactericidal and independent of temperature and energy. The activity was mainly due to the inhibition of cell-membrane synthesis in the bacteria. Seed oil showed inhibition against the tested fungal and bacterial cultures. The efficacy of antimicrobial activity of the seed oil at four concentration levels (50%, 80%, 90% and 100%) against various pathogenic indicators was found to be concentration-dependent.

The various organic extracts of chloroform, ethyl acetate and methanol, derived from the leaves of *Pongamia pinnata* (L.) Pierre was evaluated for antibacterial potential against some representative food spoilage and food-borne pathogenic bacteria like *Bacillus subtilis*, *Staphylococcus aureus* (*ATCC6538*), *Listeria monocytogenes* (*ATCC19118*), *L. monocytogenes* (*ATCC19166*), *Pseudomonas aeruginosa* (*ATCC6432*) and *Salmonella typhimurium* (*ATCC25212*). The organic extracts of chloroform, ethyl acetate and methanol, at a concentration of 2500 µg/mL. The chloroform, ethyl acetate and methanol extracts displayed significantly higher antibacterial activity as compared to streptomycin. This study suggests that *P. pinnata* may have potential antimicrobial agent.

**Antioxidant and Anti-hyperammonemonic Activity**

The effect of *Pongamia pinnata* leaf extract (PPEt) on circulatory lipid peroxidation and antioxidant status was evaluated in ammonium chloride-induced hyperammonemic rats. Enhanced lipid peroxidation in the circulation of ammonium chloride-treated rats was accompanied by a significant decrease in the levels of vitamin A, vitamin C, vitamin E, reduced glutathione (GSH), glutathione peroxidase (GPx), superoxide dismutase (SOD), and catalase (CAT). PPEt-administered rats experienced a significant reduction in lipid peroxidation with a simultaneous elevation in antioxidant levels. The results indicate that PPEt modulates these changes by reversing the oxidant-antioxidant imbalance during ammonium chloride-induced hyperammonemia and this could be due to its anti-hyperammonemonic effect by means of detoxifying excess ammonia, urea and creatinine and antioxidant property.

**Hepatoprotective Activity**

Effect of *Pongamia pinnata* leaf extract (PPEt) were studied for its hepatoprotective effect during ammonium chloride induced hyperammonemia. Ammonium chloride treated rats showed significant increase in the level of circulatory ammonia, urea, bilirubin, AST, ALT, ALP, LDH, GGT, TBARS and HP. These levels were decreased in PPEt treated animals. The result indicates that PPEt offers hepatoprotection by influencing the level of lipid peroxidation products and liver markers in experimental hyperammonemia and this could be due to its ability to detoxify excess ammonia, urea and creatinine and free radical scavenging property by means of reducing lipid peroxidation and the presence of natural antioxidants.

**Anti-ulcer Activity**

The present work includes study of ulcer protective and healing effect of methanol extract of seed of *Pongamia pinnata* (PPSM) in rats. PPSM showed ulcer protection effect against gastric ulcer induced by cold stress, pyloroscopic ligation, aspirin and duodenal ulcer induced by cysatein but not protective action against ethanol...
induced gastric ulcer. It also cured chronic gastric ulcer induced by acetic acid. PPSM tended to decrease the acid output and increased mucin secretion and mucosal cell shedding, glycoproteins, proliferation and anti oxidants; catalase (CAT), superoxide dismutase (SOD) and glutathione (GSH) levels. Thus it shows significant anti ulcer activity.

Sequential petroleum ether, benzene, chloroform, acetone and ethanolic extracts of Pongamia pinnata roots are administered in the dose of 50 mg/kg i.p., they were also found to possess antiulcer effects when administered either by i.p. (45 min before) or oral route (45 min before or for 4 days) against restraint-stress or pylorus-ligated gastric ulcers in rats, the maximum protection being afforded by petroleum ether and ethanol extracts. The mechanism of antiulcer effect could either be due to decrease in acid-pepsin secretion and augmentation of mucin secretion as observed with ethanol extract, while petroleum ether extract might be producing the effect by virtue of its anti-stress activity.

The Present study was designed to investigate the antiulcer effect of hydroalcoholic extract of leaves of P. pinnata (HLEPP) in aspirin or ethanol or indomethacin or pylorus-ligated models of gastric ulceration in rats. HLEPP was administered in the dose of 400 mg/kg orally in all experiments. HLEPP at the dose of 400 mg/kg produced a significant reduction in the ulcer index. HLEPP significantly inhibited gastric mucosal damage induced by aspirin, ethanol, and indomethacin and in pylorus-ligated rats. The anti-ulcer effect was further confirmed histologically. The above effects of HLEPP may also be due to the presence of tannins and flavonoids in the extract.

The methanolic extract of Pongamia pinnata roots showed significant protection against aspirin, but not against ethanol-induced ulceration. It showed tendency to decrease acetic acid-induced ulcers.

**Anticonvulsant activity**

The anticonvulsant effect of 70% ethanol extract of Pongamia pinnata leaf against pentylene tetroazole induced convulsion (PTZ) in rats was evaluated. The ethanolic extract showed significant anticonvulsant activity by lowering the duration of extension phase (3.72 ± 0.65) when compared to control group (8.94 ± 0.42). From the experiment Pongamia pinnata had shown significant anticonvulsant activity.

Investigation of the anticonvulsant efficacy of 70% ethanol leaf extract of Pongamia pinnata using maximal electroshock-induced seizure (MES) in mice showed significant anticonvulsant activity by lowering the duration of extension phase (4.12 ± 0.67) when compared to control group (9.64 ± 0.41). These significant results indicate that the anticonvulsant action of Pongamia pinnata leaf extract on mice, probably due to the presence of flavonoids.

**Hypoglycemic and Hypolipidemic Activity**

The methanol extract of pod, flower of Pongamia pinnata (Linn.) Pierre of was evaluated for its hypoglycemic and hypolipidemic activity in streptozotocin induced diabetic rats. A new difuranoflavonone Compound PP (named Pongamiaflavonol), isolated from methanolic extract of P. pinnata pods was also studied for the activity. It was observed that after 14 days of treatment blood glucose level was reduced by 66.34, 54.82, 63.62 and 67.48 % with Std. Glibenclamide 3 mg kg⁻¹, P. pinnata pods (300 mg kg⁻¹), P. pinnata flowers (300 mg kg⁻¹) and PP (100 mg kg⁻¹), respectively. The lipid profile was also studied and was found to be normalized significantly by both the flowers and pods extracts of P. pinnata and compound PP.

**Antihyperglycemic and Antilipidperoxidative Effect**

The antihyperglycemic and antilipid peroxidative effect of ethanolic extract of Pongamia pinnata (Linn.) Pierre flowers (PpEt) was evaluated in normal rats and in alloxan induced diabetic rats. The oral administration of ethanolic extract of Pongamia pinnata flowers (300 mg/kg bw) showed significant antihyperglycemic, and antilipidperoxidative effects and enhancement in antioxidants defense system in alloxan induced diabetic rats. However, no significant characteristic changes were noticed in blood glucose level as well as in lipid peroxidation and antioxidant status in normal rats treated with “PpEt” alone. Thus the “PpEt” could be used as a safe alternative antihyperglycemic drug for diabetic patients.

**Antiviral Activity**

Pongamia pinnata, Linn. for treatment of clinical lesions of skin and genital, was evaluated for antiviral properties against herpes simplex virus type-1 (HSV-1) and type-2 (HSV-2) by in-vitro studies in Vero cells. A crude aqueous seed extract of P. pinnata completely inhibited the growth of HSV-1 and HSV-2 at concentrations of 1 and 20 mg/ml (w/v), respectively, as shown by complete absence of cytopathic effect.

**Antidiabetic activity**

The antidiabetic activity of petroleum ether, chloroform, alcohol and aqueous extracts of P. pinnata leaf extracts was investigated in alloxan-induced diabetic albino rats. P. pinnata ethanolic extract (PPE) and aqueous extract (PPEAE) showed significant (P < 0.001) antidiabetic activity. The drug has the potential to act as an antidiabetic drug.

The antidiabetic activity of cycloart-23-ene-3beta, 25-diol isolated from stem bark of Pongamia pinnata was evaluated against streptozotocin-nicotinamide induced diabetic mice. It showed significant antidiabetic activity.

**Renal protective activity**

Ethanolic extract of flowers of Pongamia pinnata was studied for its protective effect against cisplatin and gentamicin induced renal injury in rats. Toxicity of
cisplatin, is measured by loss of body weight, elevated blood urea and serum creatinine declined significantly. Ethanolic extract of flowers had a marked nitric oxide free radical scavenging effect, suggesting an antioxidant property. Two flavonoids, known for their antioxidant activity viz. kaempferol and 3, 5, 6, 7, 8-pentamethoxy flavone were isolated from the extract. The flowers of *Pongamia pinnata* had a protective effect against cisplatin and gentamicin induced renal injury through antioxidant property\(^\text{45}\).

**Pongamia pinnata** as Bio fuel

*Pongamia* seed oil as a bio- fuel has physical properties very similar to conventional diesel. Emission properties, however, are cleaner for Bio- fuel than for conventional diesel. It has no polyaromatic compounds and reduced toxic smoke and soot emissions. A drastic reduction in sulphur content (<50ppm) and higher cetane number (>50) will be required in the petroleum diesel produced by Indian refiners. However, bio-fuel meets these two important specifications and would help in improving the lubricity of low sulphur (0.13-0.16%) diesel. The present specification of flash point for petroleum diesel is 350°C which is lower than all the countries in the world (>550°C), Bio-fuel will help in raising the flash point, a requirement of safety\(^\text{50}\).

The level of erucic acid and the presence of toxic flavonoids, for example karanjin, pongapin, and pongaglabrin, render the oil inedible according to WHO recommendations. However, low levels of saturated and polyunsaturated fatty acids with desirable cetane number and iodine value suggest potential for application as a biodiesel fuel\(^\text{31}\).

**CONCLUSION**

In recent years of scientific investigations, attention has been drawn to the health promoting activity of plant foods and its active components. Many herbal remedies have been recommended in various medical treatises for the cure of different diseases. This plant is a multipurpose tree with immense medicinal and economic value. The
